Heterocyclic chemistry is the branch of organic chemistry dealing with the synthesis, properties, and applications of these heterocycles. Examples of heterocyclic compounds include all of the nucleic acids, the majority of drugs, most biomass, and many natural and synthetic dyes. 59% of US FDA-approved drugs contain nitrogen heterocycles, due to its ability to

Heterocyclic compound---Wikipedia

In replacement nomenclature, the heterocycle's name is composed of the carbocycle's name and a prefix that denotes the heteroatom. III. The Replacement Nomenclature Thus, "aza", "oxa", and "thia" are prefixes for a nitrogen ring atom, an oxygen ring atom, and a sulfur ring atom, respectively. Notice that heterocyclic rings are numbered so

Nomenclature of Heterocyclic Compounds

Examples of this nomenclature are: ethylene oxide = oxacyclopropane, furan = oxacyclopenta-2,4-diene, pyridine = azabenzene, and morpholine = 1-oxa-4-azacyclohexane. The Hantzsch-Widman system provides a more systematic method of naming heterocyclic compounds that is not dependent on prior carbocyclic names.

Heterocyclic Chemistry

Nomenclature of heterocyclic compounds: There are three systems for naming heterocyclic compounds: 1-Common Nomenclature 1) Each compound is given the corresponding trivial name (which should be memorized). This usually originates from the compounds occurrence, its first preparation or its special properties.

Alternative Title: heterocycle. Heterocyclic compound, also called heterocycle, any of a major class of organic chemical compounds characterized by the fact that some or all of the atoms in their molecules are joined in rings containing at least one atom of an element other than carbon (C).

Heterocyclic compound+chemistry+Britannica

The Hantzsch-Widman naming system is used to name heterocycles. Firstly, a prefix is given for the element other than carbon which makes up the heterocycle: Following this, the vowel at the end of the prefix is removed, and a suffix is added.

UPC-213---Heterocyclic Chemistry---Lecture Notes+DR---

This chapter is entirely devoted on the nomenclature of various monocyclic, bicyclic, tricyclic, and polycyclic, including ortho-fused, ortho-peri-fused, bridged, and spiro, heterocycles with one or more similar or dissimilar heteroatoms present in the cyclic system. In heterocyclic chemistry every heterocyclic system has a special name, while individual compounds are named also by a trivial name based on their origin of occurrence or on their special properties.

The two quinolines illustrate another nuance of heterocyclic nomenclature. Thus, the location of a fused ring may be indicated by a lowercase letter which designates the edge of the heterocyclic ring involved in the fusion, as shown by the pyridine ring in the green shaded box. Heterocyclic rings are found in many naturally occurring compounds.
